ADEPA FOOD HUT

Product Requirements Document

A clear, client-friendly definition of the product, its users, launch scope and proposed delivery plan.

DOCUMENT	PRD
VERSION	0.1 — Discussion Draft
DATE	5 November 2026
PLATFORM	WordPress with custom PHP functionality
HOSTING	Hostinger Pro (exact plan and environment to be verified)
STATUS	For stakeholder review and technical discussion

Core principle: One connected system. Three user experiences — public website, customer portal and administrator dashboard.

Prepared as a working baseline for discussion. Items requiring client confirmation or technical validation are explicitly identified rather than treated as final decisions.

Document guide

This document explains what ADEPA Food Hut is intended to deliver and why. It is written for the business owner and project stakeholders. The companion SRS defines the detailed functional and technical requirements.

Contents

1. Product vision and principles
2. Business context and objectives
3. Users and experiences
4. Launch scope and page structure
5. Key customer journeys
6. Operational requirements
7. Non-functional expectations
8. Proposed implementation plan
9. Assumptions, exclusions and decisions to confirm

1. Product vision and principles

ADEPA Food Hut will be a professional, easy-to-use food ordering and delivery website built on WordPress. Customers will be able to create an account, browse the menu, submit a delivery order and follow its progress. The business team will manage menus, orders, delivery arrangements and website content through a protected administration experience.

The product is deliberately focused: deliver a reliable launch experience without introducing unnecessary complexity such as online card checkout, customer loyalty schemes or live GPS tracking.

One connected system. Three user experiences.

Experience	Who uses it	What it does
Public website	Visitors and prospective customers	Introduces the business, explains delivery and presents the menu.
Customer portal	Registered customers	Supports account access, ordering, order history and interactive status tracking.
Admin dashboard	Authorised staff	Manages orders, menu availability, operating hours, delivery decisions, payments and content.

Product principles

- **Simple for customers:** clear navigation, readable menu, straightforward ordering and useful status updates.
- **Practical for staff:** a focused dashboard that supports daily operations without requiring code changes.
- **Connected data:** the public menu, customer order and admin dashboard use the same authoritative data.
- **Safe order handling:** server-side checks validate prices, availability, operating hours and order state.
- **Maintainable:** business logic should remain independent of the visual theme or page builder.

2. Business context and objectives

ADEPA Food Hut operates a delivery-focused food service from its base of operations in the Milton Keynes / Northampton service area. At launch, the website will accept delivery orders only. Customers will not collect orders from the premises.

Business objectives

- Provide a credible, polished online presence with distinct website pages.
- Allow customers to register and place orders without mandatory email verification.
- Support delivery enquiries and orders for Milton Keynes and Northampton, subject to manual serviceability confirmation.
- Give staff control over order acceptance, preparation and delivery status.
- Keep the menu current and allow individual dishes to be marked unavailable.
- Record offline payment method and payment status accurately.
- Create a foundation for email and SMS notifications and future improvements.

3. Users and experiences

Customers

- Create an account and sign in.
- Browse the current standard menu and view item details, prices and availability.
- Build an order, enter delivery details and submit it during permitted ordering hours.
- Choose from the offline payment methods enabled by ADEPA.
- View current and previous orders and follow an interactive order-status timeline.

Administrators and order staff

- Review new orders and manually accept or reject them.
- Update order progress through the agreed statuses.
- Manage menu items, categories, prices, photographs and availability.
- Manage operating hours, order cut-off times and temporary closures.
- Review delivery addresses and manually confirm whether delivery is possible and the delivery charge.
- Record whether payment has been received.
- Manage supported website content and notification settings.

4. Launch scope and page structure

The public website must be a genuine multi-page website. Primary navigation links open their own URLs; they must not merely scroll to sections on one long homepage.

Area	Page / route	Purpose
Public	Home — /	Brand introduction, featured food and clear calls to action.
Public	Menu — /menu	Full menu, categories, item details, prices and availability.

Area	Page / route	Purpose
Public	About — /about	Business story and relevant information.
Public	Delivery — /delivery	Delivery coverage, process and manual confirmation explanation.
Public	Contact — /contact	Contact details and enquiry route.
Public	Privacy — /privacy	Privacy information and customer-data practices.
Public	Terms — /terms	Ordering, delivery, cancellation and payment terms.
Customer	Register / Login	Customer account creation and access.
Customer	Account — /account	Account overview and profile management.
Customer	My Orders — /account/orders	Current and previous orders.
Customer	Order Details — /account/orders/{id}	Order summary, payment information and tracking timeline.

Admin dashboard modules

Module	Purpose
Dashboard	At-a-glance order and operational overview.
Orders	Review, accept, reject and process incoming orders.
Order Tracking	Update order status and review status history.
Menu Management	Manage dishes, categories, descriptions, prices and images.
Availability	Mark items available or sold out.
Business Hours	Manage opening windows, cut-offs and closures.
Customers	View customer records and relevant order history.
Delivery Management	Review delivery details and confirm serviceability and charges.
Website Content	Edit agreed public-facing content.
Notifications	Configure supported email and SMS events.
Settings	Manage business settings and administrator permissions.

5. Key customer journeys

Registration and ordering

1. A visitor selects Register and creates an account using the required details.
2. The account becomes usable immediately; email verification is not a prerequisite to ordering.
3. The customer signs in, browses the menu and adds available dishes to the basket.
4. The customer enters delivery details and any relevant delivery instructions.
5. The customer selects an offline payment method currently enabled by ADEPA.

6. The customer submits the order. The system validates the menu, prices, item availability, delivery information and ordering window on the server.
7. The order is saved as pending / awaiting approval and the customer receives an order reference and confirmation that the request was received.

Order handling and tracking

1. An administrator reviews the pending order and delivery details.
2. The administrator confirms delivery feasibility and any applicable delivery charge, then accepts or rejects the order.
3. If accepted, the administrator advances the order through preparation and dispatch.
4. The customer sees the current status and completed stages in the account tracking module.
5. The administrator marks the order delivered when fulfilment is complete and records payment receipt when applicable.

6. Operational requirements

Topic	Launch rule
Menu model	One standard menu, updated as needed; individual dishes can be unavailable.
Ordering ahead	Not permitted. Orders can only be submitted within configured permitted ordering hours.
Closed periods	Menu remains browsable, but new orders cannot be submitted.
Delivery	Delivery only at launch; no customer pickup or collection.
Delivery area	Milton Keynes and Northampton are the stated target areas; each address is subject to manual confirmation.
Order acceptance	All submitted orders await administrator review and acceptance or rejection.
Payments	Offline methods only. No online payment gateway at launch.
Delivery charge	Confirmed manually by the business; do not imply an unapproved automatic calculation.
Customer accounts	Required to order; no mandatory email verification before ordering.
Tracking	Interactive status timeline; no live GPS tracking in the launch scope.
Notifications	Email and attempted SMS integration; notification failure must not lose or block an order.

7. Non-functional expectations

- **Responsive:** usable on mobile, tablet and desktop, with mobile ordering treated as a priority.
- **Accessible:** clear contrast, keyboard access, meaningful labels and understandable validation messages.
- **Secure:** protected admin access, least-privilege roles, secure password handling, server-side validation and protection of customer data.
- **Reliable:** an order must be persisted before success is shown; failures must be visible and recoverable.
- **Performance:** optimised images, restrained animation, caching where safe and no unnecessary scripts.
- **Maintainable:** custom business logic must not be embedded solely in the theme or page-builder layouts.
- **Privacy:** collect only data needed for accounts, fulfilment, support and legitimate business records.

8. Proposed implementation plan

The work should be delivered in controlled phases. Each phase should be reviewed and tested before the next phase depends on it.

Phase	Scope and outputs	Exit criteria
0. Discovery & audit	Confirm Hostinger product and access; inspect current WordPress/site, domain, existing data, plugins and any working ordering features. Agree page builder and ordering architecture.	Environment documented; keep/replace decisions recorded; staging and backup approach agreed.
1. Foundation & design system	Set up development/staging workflow, custom theme foundation, navigation, global styles, reusable sections and public page templates.	Responsive multi-page shell approved; navigation routes work; editable content model demonstrated.
2. ADEPA Core backend	Build plugin foundation, roles/capabilities, database structures, settings, business hours, menu and availability services.	Secure admin access; menu changes persist; availability and ordering-window rules tested.
3. Customer accounts & ordering	Registration/login, account pages, basket, delivery details, offline payment selection and order submission.	Customer can register, order and view their own orders; server validates every submission.
4. Admin operations & tracking	Admin order queue, accept/reject actions, status transitions, status history, customer timeline and delivery-charge confirmation.	Admin actions persist and are reflected correctly in the customer portal.
5. Notifications & content	Email events, evaluate and integrate an SMS provider, editable public content and operational settings.	Notification failures are handled safely; staff can edit approved content without code.
6. QA, launch & handover	Functional, security, accessibility, responsive and performance testing; backup/restore check; production deployment and staff guidance.	Launch checklist passed; client approves; access, maintenance and recovery instructions handed over.

Recommended delivery approach

Build and test on a staging copy rather than experimenting directly on the live website. Keep source code in version control. Deploy reviewed changes to production with a backup and rollback plan. The client should receive a short operating guide for managing orders, menu availability and content.

9. Assumptions, exclusions and decisions to confirm

Confirmed business decisions

- WordPress is the selected platform; PHP may be used for custom backend functionality.
- The client reports having Hostinger Pro; exact plan, access and resources must be verified.
- One standard menu is used and updated as needed.
- No advance ordering; ordering is limited to configured operating windows.
- Delivery only at launch; no customer pickup.
- Milton Keynes and Northampton are the intended delivery areas, subject to manual confirmation.
- Administrator reviews and accepts or rejects every submitted order.
- Customers must create accounts; email verification is not required before ordering.
- Offline payment methods only; cash and other approved offline methods may be supported.

- Customers receive an interactive order-status timeline.
- SMS integration will be attempted; email notification support should also be provided.

Decisions / validation still required

- **Page builder:** confirm Gutenberg / native Site Editor or Elementor. Recommendation: Gutenberg unless the client has a strong Elementor preference.
- **Ordering engine:** decide between WooCommerce customised for ADEPA or a custom ADEPA ordering plugin. This requires a short technical comparison before database design is finalised.
- **Payment methods:** confirm the actual offline methods accepted and whether bank transfer must be paid before dispatch or can be confirmed manually.
- **Delivery charge workflow:** confirm whether the customer submits an order with delivery fee marked pending, or staff confirm the fee before the order is formally accepted.
- **Delivery detail:** confirm required address fields and how staff will assess serviceability within the two target areas.
- **Business rules:** confirm opening days, hours, last-order cut-off, temporary closure process and time zone (UK local time, including GMT/BST).
- **Existing system:** inspect the current website and decide what data, routes, accounts, plugins or order history must be preserved.
- **Hostinger:** verify exact plan, PHP/database versions, staging, backups, SSH/SFTP and deployment access.

Out of scope for launch unless separately approved

- Online card payment gateway or payment processing.
- Customer pickup / collection.
- Advance or scheduled orders.
- Live GPS driver tracking.
- Loyalty points, subscriptions or complex promotions.
- Native iOS or Android applications.
- Automated delivery-zone pricing unless later approved.

Approval status

This PRD is a discussion draft. It records the business decisions supplied so far and proposes a delivery plan. It is not yet a final scope or fixed-price commitment. Final approval should follow resolution of the open decisions and technical audit.
